FEATURE:
NAME/KEY: misc_feature
LOCATION: (1064)...(1064)
OTHER INFORMATION: nucleotide 1064 of DCMP2s may be A, which would encode Asn rather
OTHER INFORMATION: than Asp at the residue numbered 270
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          nucleot

The receptor recognizes terminal galactose and N-acetylgalactosamine units. After ligand binding to the receptor, the resulting complex is internalized and transported to a sorting organelle, where receptor and ligand are disassociated. The receptor then returns to the cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -i- SUBCELLULAR LOCATION: Type II membrane protein.

                                                                                                         -1- MISCELLANEOUS: Calcium is required for ligand binding.
-1- MISCELLANEOUS: Two types of rat hepatic lectin have been identified, RHL-1 and RHL-2/3, having a relative abundance of 4:1.
-1- SIMILARITY: Contains 1 C-type lectin family domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        2 TRIYENFQYLENKVKVQGFKNGPLPLQSLLQRLRSGPCHLLLSLGLGLLLLVIICVVGFQ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                    SUBUNIT: Interacts with LASS2 (By similarity).
SUBCELLULAR LOCATION: Type II membrane protein.
TISSUE SPECIFICITY: Expressed exclusively in hepatic parenchymal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Endocycor.

Gene 148:237-244(1994).
-!- FUNCTION: Mediates the endocytosis of plasma glycoproteins to
which the terminal stalic acid residue on their complex
carbohydrate moieties has been removed. The receptor recognizes
terminal galactose and N-acetylgalactosamine units. After ligand
binding to the receptor, the resulting complex is internalized and
transported to a sorting organelle, where receptor and ligand are
disassociated. The receptor then returns to the cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PROSITE; PSO0615; C_TYPE_LECTIN 1; 1.

for galactoses/N-acetyl-galactosamine from tumoricidal macrophages.";

J. Biochem. 104:600-605(1988).

-! FUNCTION: Recognizes terminal galactose and N-acetylgalactosamine macrophages and tumor cells.

-! SUBGINIT: Homooligomer.

-! SUBGINIT: Homooligomer.

-! SUBCELIULAR LOCATION: Type II membrane protein.

-! TISSUE SPECIFICITY: Expressed on the surface of activated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       3 YENLONSRIEEKTQ--EPGKAPSQSFLWRILSWTHLLLFSLGLSLLLLVVVSVIGSQNSQ

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                terminal galactose and N-acetylgalactosamine units. After ligand binding to the receptor, the resulting complex is internalized and transported to a sorting organelle, where receptor and ligand are disassociated. The receptor then returns to the cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       gurface.
Subsurf: The functioning ligand-binding unit of this receptor is
thought to be at least a dimer. Interacts with LASS2.
SUBCELLULAR LOCATION: Type II membrane protein.

Natl. Acad. Sci. U.S.A. 99:16899-16903(2002).
-!- FUNCTION: Mediates the endocytosis of plasma glycoproteins to which the terminal sialic acid residue on their complex carbohydrate moieties has been removed. The receptor recognizes terminal galactose and N-acetylgalactosamine units. After ligand binding to the receptor, the resulting complex is internalized and transported to a sorting organalle, where receptor and ligand are disassociated. The receptor then returns to the cell membrane
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      PRINTS; PRO0356; ANTIFREZZII.
